

Off-grid Solutions Project

 Kenya Activity Report

School staff and members of the Local committee participated in a technical training session

Using the solar power generator and power storage system devices (Solar Stations) we installed, we conducted technical training such as teaching basic knowledge about electricity, how to use batteries efficiently, and daily system maintenance points. Around 20 people attended, including school staff, members of the community committee, and dispensary staff. The participants enthusiastically listened to the lecturer's talk, who was an engineer from Panasonic's Eco Solutions Company. After finishing the training, there were a number of comments from participants, such as, "I've understood the importance of managing the figures every day," and "It's exciting to think that we will be able to use electricity every day." (January 2019)
